Urban Form and Resilience. Compact neighbourhoods with mixed land use reduce car dependence and shorten the daily commute. Transit oriented development concentrates housing within walking distance of frequent rail and bus services. Adaptation planning works best when engineers, ecologists and residents agree on which places must be defended and which can be allowed to change. Green roofs lower building temperatures in summer and slow the release of rainwater into overloaded sewers. Participatory budgeting gives residents direct control over a share of public spending in their district. Zoning reform that permits small apartment buildings has increased housing supply without large public subsidies.
